Evaluation criteria

Decision and Scoring Logic	Quality, consistency, and explainability of the methodology used to derive, evaluate, score, and prioritize product requirements. The solution should clearly demonstrate which factors influence decisions, how evidence and data sources are weighted and combined, and how trade-offs, uncertainties, and conflicting signals are resolved.
Workflow and Human Decision-Making	Quality and completeness of the end-to-end workflow from heterogeneous findings to prioritized requirements, including clearly defined roles, decision gates, review steps, and boundaries between AI-supported, autonomous, and human decisions.
Traceability and Auditability	Ability to trace every requirement, score, modification, and decision back to its originating evidence and sources, including a complete and reconstructable history of approvals, modifications, postponements, and rejections.
Solution Quality, Usability, and Feasibility	Quality of the concept or prototype, usefulness of the generated requirements, ease of use for product managers and engineering teams, and realistic applicability within a complex enterprise product development environment.
Innovation, Scalability, and Business Impact	Originality and effectiveness of the solution, its potential to scale across products, markets, and data volumes, and its expected contribution to reducing manual effort and rework, shortening decision cycles, and improving requirement and decision quality.

We reward honesty. Trustworthy AI acknowledges uncertainty. Show us where your app lacks evidence, encounters conflicting signals, or reaches uncertain conclusions, and how this is surfaced to the PM. Honest limitations are a strength, not a weakness.
